<sup>D</sup> Filariasis: **Definition:**

Filariasis is the name for a group of tropical diseases caused by various thread-like parasitic round worms (nematodes) and their larvae.

\*alfileria A genus of the family bromoviridae with a wide host range.  
Transmission is by aphids and the type species is alfalfa mosaic virus.

So what Nostradamus is saying here, is that a virus is carried by the parasite worm.

April 24, 2010 - New, Deadly, Airborne Fungus Spreading from Oregon.

*“The alarming thing is that it's occurring in this region, it's affecting healthy people, and geographically it's been expanding.”*

- Edmond Byrnes, Grad Student Researcher, Joseph Heitman Lab, Duke Univ.

*Cryptococcus gattii* fungus, native to Papua New Guinea, Australia and parts of South America, is now spreading airborne in Oregon and has killed six of twenty-one infected people, or about 25%. Currently, there is no vaccination or other preventative measure available for this new lethal fungus. Symptoms of severe cough and shortness of breath do not develop until months after exposure. The fungus has also infected domestic and wild animals. See: [PLoS Pathogens](#).
